

## (C)One Oil Terminal

is built with particularly insightful knowledge and experience

From a bird's-eye view, an oil terminal looks elegantly simple. It is a set of cylindrical tanks of varying sizes. But if you land and come closer, another wave of impressions will hit you: the impressions of pipes, valves and pumps, a complex system. In addition, safety regulations, customs rules, the market and clients' requirements are more complex than the pipe system itself.

Nowadays, you have to manage all of that promptly with no margin of error at any level, whether you are taking a global make-or-break decision or opening a small valve.

The solution is (C)One Oil Terminal, which maintains top-down and bottom-up approaches in management and information flow

We offer you a **one enter** solution for your oil terminal. With (C)One Oil Terminal every terminal activity is well planned and under control from the very beginning to the very end. It conforms with all rules and requirements. All information is transparently accessible and no double input is necessary.

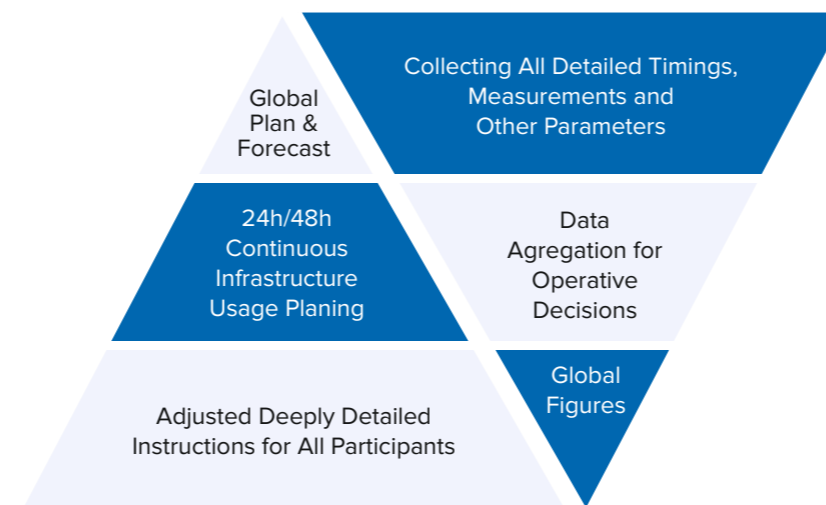

(C)One Oil Terminal is developed for your business to increase the quality of internal processes and services for your clients.
